It is available to download on both Android and iOS devices for free. The game offers different maps and modes to play with, including a 100-player Battle Royale battleground, Fast 5v5 team death-match, Sniper vs Sniper battle etc. The size of the Call of Duty game is around 1.7 GB. Along with an additional resource pack, the developers also push out regular updates of varying sizes. Sometimes players do not wish to exhaust their data. Thus they look to find alternate ways of playing the game, such as by using cloud servers. While many websites claim to do so, the fact of the matter is that there is no cloud server where the players can play Call of Duty Mobile without downloading and exhausting your data is to get the APK and OBB files of the game through apps like Shareit, Xender etc. from someone who has the game. Steps to play Call of Duty without downloading the game: Here are the steps to play Call of Duty Mobile without downloading the game: # 1: Receive the APK and OBB file of COD Mobile using the apps mentioned above # 2: After receiving the file, go to the file manager and install the APK file of the game. Allow installation of unknown sources by navigating to Settings > Safety and Privacy > Install Apps from Unknown Sources. # 3: Once the installation gets done, copy the OBB file of the game to Internal Storage/SD card > Android > OBB > com.activision.callofduty.shooter.OBB File # 4: Now, open the Call of Duty Mobile application in your device.# 5: Login with your Facebook, or Guest account and play the game.The size of the APK file is around 70MB, and that of the OBB file is about 1.6 GB. In case of the error "Problem parsing package" popping up, consider re-installing the game by repeating the steps mentioned above. Edited by Bhargav Coming soon! In this digitalized world, most of our data is saved on our phones, whether personal or work-related. It also requires us to download tons of applications for different functions. These apps can take up a lot of space on our phones, and despite the sizeable internal storage, filled storage space can significantly slow down the phone. An easy solution is using the external SD card. If you are unsure how to transfer apps to SD card in oppo A3s, read ahead. However, there are always various ways of doing anything. Here we have compiled the most straightforward options available with detailed steps to make this process as simple as possible. Part 1: How to Transfer Apps to SD Card Oppo A3s If you have a lot of apps installed on your Oppo A3s, you might want to consider moving those apps to the SD card because otherwise, you'll soon be facing insufficient storage problems. To transfer apps to sd card oppo a3s, you can use this hassle-free in-built method. Let me explain the steps of the transfer in detail. 1. Open "Settings" on your phone. Then click on "APPS" or "APP MANAGEMENT". 2. All the apps of your phone, whether installed or by default, will be displayed here. Click on any of as many apps as you want to transfer to your SD card. 3. After clicking on the app, a page with app details will pop open. Click on storage. 4. A pop-menu will open with options on where to save the application. Here you have to click on the SD card. The application will be instantly transferred to the SD card. NOTE: You need to have an SD card inserted in your phone. But if you still don't see the option of moving to SD card in step 4, I'll show you another way to transfer your apps. Recommended reading: Part 2: how to Transfer Files from Phone to SD Card Oppo A3s with One-Tap Transfer If the first method is not available on your phone, you can use this tried and tested super-easy process to transfer apps to the SD card in oppo A3s. One-Tap transfer, as the name suggests, allows rapid transfer of data to the SD card. It is in-built in your phones, so you don't need to worry about downloading it. You can use it to transfer pictures, videos, audio files, and applications (APK). However, the only limitation is that it only works on ColorOS version of 5.2 or above (Check your OS version in settings>about the phone) Let me walk you through all the steps:- 1. Open the settings menu and click on additional settings. 2. Tap on storage. You will see apps divided into two portions. On the left is the Phone and the SD card is on the right. Tap on SD Card and then click on the circle with i in the top right corner. 3. Tap on storage again 4. In storage and performance, tap on Transfer to SD Card. 5. Now press Start transferring to enable One-Tap transfer. 6. Tick the item or items you want to transfer and click Start Transferring again. Once your transfer is complete, you can access your files from the File manager, and the photos and videos will be in your gallery. I guess this is by far the easiest method of oppo transfer to the SD card. Part 3: Save More Space for Your Oppo by Backup Phone to Computer MobileTrans by Wondershare has an easy interface, and to use its backup feature, you don't need to purchase a license. Lucky for us, this essential feature is free for use after installation. You can easily create a backup of your phone on your pc. Data ranging from pictures, videos, audio files to Whatsapp chats, including media files, can be backed up in a few clicks. Free Download Free Download safe & secure Why should we back up our phones? There are two reasons for this 1. Data is saved from being deleted or lost: Since we live in a digitalized era, we tend to save all our data and essential information on our phones for quick and easy access. But this easy saving method can sometimes be very dangerous. You can lose your phone, or you may accidentally format your phone. Imagine how awful it would be to lose all your important documents or old pictures. So, by creating a backup on your computer, you can stop worrying about losing it. 2. Backed up data can be deleted from the phone to free up space: Data such as old pictures, documents, or your favorite audio and video files that you don't regularly use or view can be saved to your computer as a backup. Since these files collectively tend to take up a lot of space, they will hinder the download of any other files or applications you currently need. But after a backup, you can delete the not-so-frequently used files and access them on your computer whenever needed. This will free up a lot of space on your phone and let it run smoothly without slowing down or getting hanged. Now I'll show you a step-by-step guide to create a backup: 1. Install Wondershare's MobileTrans. The first page you'll see will list a few options. We will click on Backup & Restore. Also, connect your phone via a USB cable. 2. Choose your phone brand. In our case, it is Oppo. Then press Start. 3. To start data transfer, you need first to enable USB Debugging. To do that, open Settings and click on about Phone. Tap on version 7 times to enter developer mode. 4. Go back to Settings and click on additional settings. 5. Now click on Developer options. To switch on Developer mode, enter the security code first. 6. Press Use, switch on developer mode and enable USB Debugging. 7. Now you are all set to start the transfer—tick all the items you want to back up and press Start. 8. The progress of the transfer will be displayed in this way. Remember to keep the phone connected to your pc until the backup is completed. All the content that you selected will be backed up to your PC in no time. Furthermore, you can quickly transfer this data onto another phone through this app, making it the most convenient and hassle-free data transfer method and backup available. Use it wisely! In the end, make sure you follow all the steps correctly and do this the right way to avoid any uncertain errors. Moving data into your SD card or to a PC has now been made easier than ever. All the methods mentioned above carry equal significance, and you can choose which method of saving disk space suits you best. Free Download Free Download safe & secure Since everything from banking to shopping has shifted to mobile, your Android phone has become an all-round tool to execute almost all your daily tasks. Besides your daily dose of social media, you're using your phone to shop, pay bills, top-ups, stream music, and even execute financial transactions. Every task you execute, every picture you download, every video you save, and every media file you share over file-sharing applications tend to occupy space on your phone. And as this space gets occupied, your phone begins to not only run out of space but also starts creating junk and associated cache files, further bulking up your internal memory. In such a scenario, it's best to move extra files from phone memory to SD card in spare to transfer all the files to the card when the internal memory is almost full. Almost every Android phone comes with an additional slot to expand your phone's memory via an SD card. In other phones, there is at the very least a hybrid slot, which can be taken up by an SD card over the second SIM card. It's not always possible to back the data over the cloud, given the limitations over storage limit and high prices for cloud services. Image Source: Android Pit Moreover, you can't always back up all the additional data on your PC. You might need those particular files on your phone and you can't carry a laptop everywhere. In such scenarios, this expandable memory comes in really handy and useful, allowing you to save space on your phone by transferring files from phone to SD card. It's an easy process to move your files from phone to an external memory card, but it's important that you know what files to move to your SD card. So, let's see how to move internal storage to SD card on your Android phone and list out what files you should leave in phone memory for good: Use A File Manager to Move Files from Phone to SD Card Image Source: Make Use Of To manage app data and transfer files from internal storage to SD card, you need a file explorer or a file manager application. Now, in Android phones, almost every manufacturer offers its own File Manager app. For example, ASUS's phone has an ASUS File Manager pre-installed in its mobile phones. Similarly, companies like Samsung and Xiaomi also have their own file manager applications. But then there are some, such as a few models of Motorola, that come without such an application. In such cases, you need a third-party file manager app, which you can get from the Play Store. While there are hundreds of them, a number of such third-party file managers run ads, and regularly prompts you to buy a premium version of that app. You'd certainly won't want to watch ads to move files from internal storage to SD card. So, using Files by Google is the best deal to transfer data from phone to SD card on your phone. Files by Google is a file management app directly from Google, that helps you free up space on your phone, remove junk, share files between phones, and most importantly, transfer files from internal storage to SD card. How to Transfer Files from Phone to SD Card using Files by Google? When you first install Files by Google, you'd be required to give it access to your phone storage. Files by Google would then scan your files on both phone memory and SD Card, which would be further listed out on the app's home page. Here, you'll be able to see the space occupied on both internal storage and expanded memory. The home page or "Clean" area in the app would have most of your bulky media files listed and would prompt you to "Select and Free Up To..." a specific amount of space on your phone. Now there are two ways to move files from internal storage to SD card - one way is to directly move files to SD Card from Clean area; second is to individually browse files and move them to specific folders. In the first method, you need to scroll down the screen through Clean area and find Move to SD Card panel. From here you can select the large media files and directly move them to SD card. Select the files you want to move and tap on "Move to SD Card". In the second method, go to Browse panel and select Internal Storage option. Here, to move files from internal storage to SD card, select them by tap & hold gesture. Suppose, if you have to move the DCIM folder to SD card, just select it, tap on the three-dots on the top-right corner of the screen, and then tap "Move to". You can then choose to move files from internal storage to an SD card. You can also designate a specific path in SD card, where you'd like that folder moved. Which Files You Should Not Move to SD Card? Despite serious urge to free up space on internal storage of your Android phone, there are certain files that are recommended to not move to any other folder than the default one. These folders contain files that support some functions of your mobile phone apps and should always be kept in internal storage: 1. OBB Files So in case, you're a PUBG lover, or even you have transferred to the latest COD Mobile, you might have noticed large "obb" files you may find in the "Android" folder on internal storage. These obb files contain app data, such as your saved progress in the game or your game statistics. These files support the continuation of the story on your game by keeping the saved data on your phone. If you move files from this folder to SD card, your concerned app would not work properly or you may lose your saved data associated with the app. So, it's recommended to not move files from obb folder anywhere else. 2. WhatsApp Database Though you can set the default path for saving WhatsApp media to SD Card, you can't do the same for WhatsApp databases. WhatsApp databases are local backups of your WhatsApp chats. These backup files allow you to retrieve previous chats if you uninstall and then reinstall WhatsApp on your Android phones. Even if you transfer these files from internal storage to SD card, a new folder will be made for the further database of chats. These databases come handy to backup previous chats beside the Google Drive backup on WhatsApp and should not be tampered with. 3. Downloaded Content from Music/Video Streaming Apps Image Source: Time Music streaming apps like Amazon Music and Spotify as well as video streaming platforms like Netflix, allow you to download content that you stream online. When you download them for offline streams, their supporting files are created on your phone These files occupy space on your phone and support offline streaming of that particular song in the future. It is recommended that you do not move these files to SD card, as in such a case, these files would render useless. To continue offline streams, you should not move these files from phone to SD card. NOTE: There are a number of tools that offer to help users transfer such files on SD card. It is recommended that you do not use such unauthorized tools. Many of them suggest you root your device and many other hampers with developer settings. It is better to keep these files in internal storage and not move to SD card. Clearing up space on your phone by transferring files from internal storage to SD card is a good option. Files by Google offer easier methods to execute the task. But it's important to know which files you must transfer and which you should keep in the internal storage all the time. Let us know in the comments how you manage files on your Android phones and suggest some more file manager applications.
